getting started

HTML + CSS : do this for the first 10–12 days

- get familiar with how simple webpages are made
- Learn basic tags, headings, images, links, buttons, forms, colors, spacing, Flexbox, Grid and responsive design.
- don’t use gpt to write code for you, can take help to understand tags

SOURCES

easy start : take some time to watch these and write code along with the video, do not make notes in your notebook **don’t**

https://youtu.be/HcOc7P5BMi4?si=bmiBX0jvwWO8u73s : it is very good, you need not watch 6hrs or 4hrs of tutorial for this

> if you don’t like the above creator then for html :
> https://youtu.be/FQdaUv95mR8?si=nhnZ3AV4PLLosUCm and for css :
> https://youtu.be/FQdaUv95mR8?si=nhnZ3AV4PLLosUCm

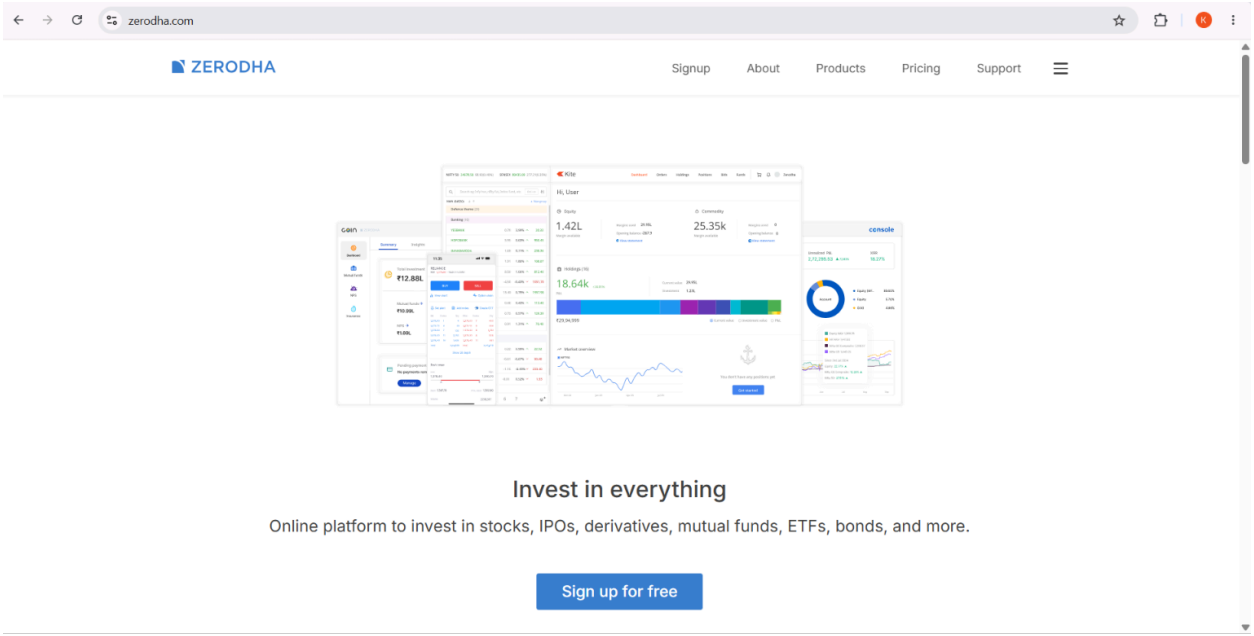

paid course : honestly not needful but she teaches nicely and it has everything, cheap (around 500) if some coupon is used :
https://www.udemy.com/course/the-complete-web-development-bootcamp/?couponCode=KEEPLEARNING

after learning css from shradha khapra or angela yu : try doing all the levels of this game https://flexboxfroggy.com/

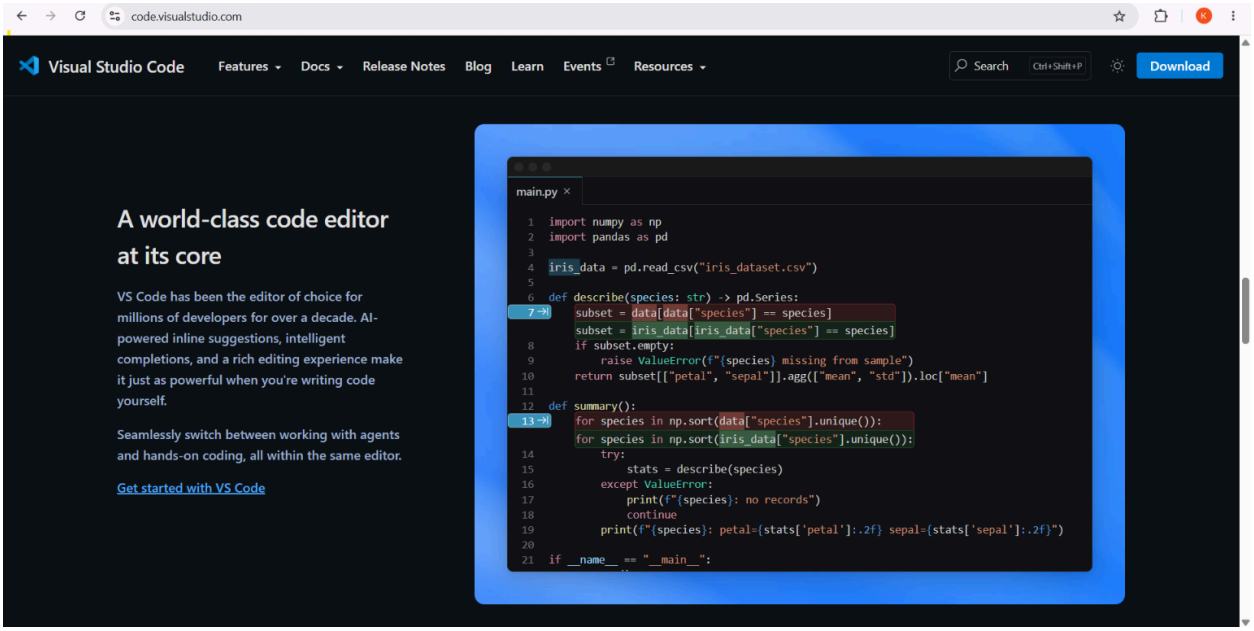

now this is the most important part :

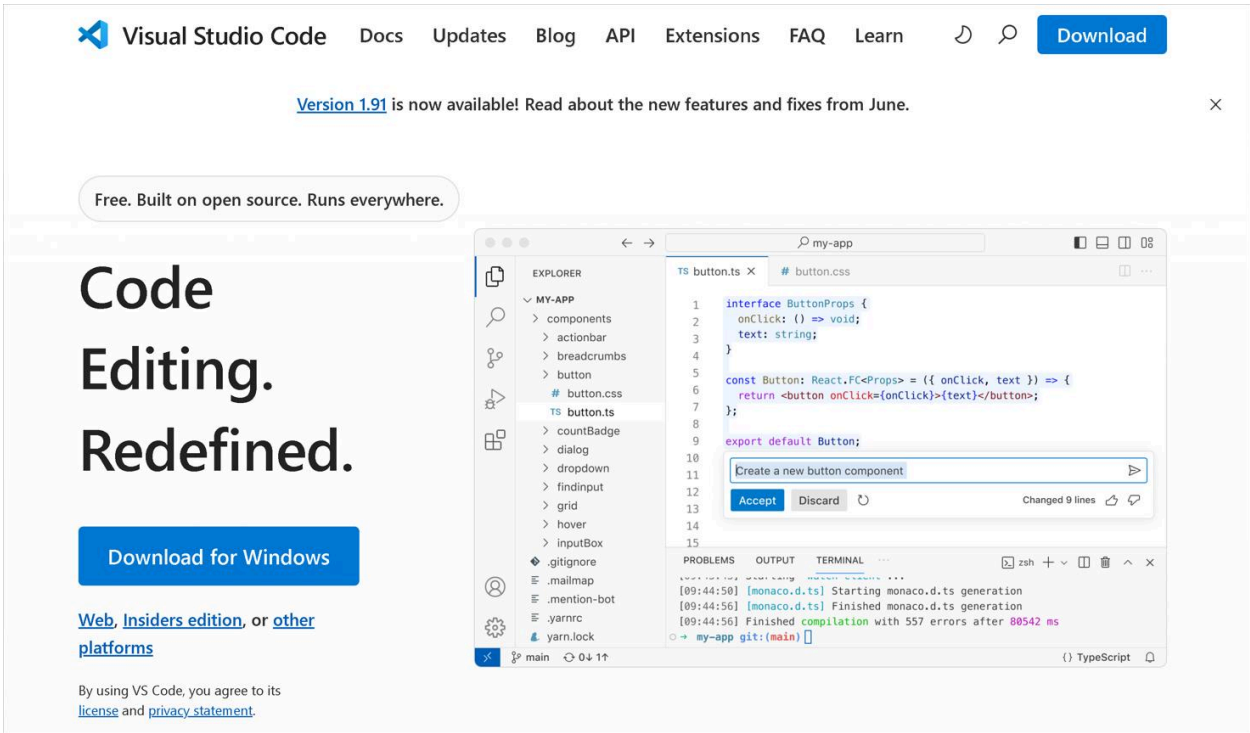

spend good chunk of time here

simply clone few webpages : for starter - zerodha landing page, try to replicate it as much as you can

replicate this vscode landing page, no one should be able to tell the difference between the actual page and your cloned version

VS Code

- Focus on matching the layout, fonts, colors, images and spacing.
- No functionality needed yet. Buttons don't have to work.

try replicating webpages you like : maybe some interesting ones like hocco icecream

make a simple webpage for yourself : introducing who you are in the most creative way possible

p.s. don’t skip the building part

JavaScript

such an easy sweet language to learn

after making webpages now learn how to make it interactive.

Choose one resource:

- Angela Yu's Web Development Udemy course.
- SuperSimpleDev's JavaScript tutorial on YouTube

- or any tutorial of your choice on youtube (shraddha khapra’s vids are also good)

focus on variables, functions, conditions, loops, arrays, objects, DOM manipulation and events.

don't just watch videos write the code and don’t make notes

Add functionality to your existing pages

For example:

- Make buttons do something.
- Create a working navigation menu.
- Add form validation.
- Build a simple calculator or to-do list.
- Add interactive elements to your landing page.

Also start making more basic webpages. The aim is to get comfortable using HTML, CSS and JavaScript together.

now start building projects : can use sites like https://www.frontendmentor.io

or mostly people refer to this : https://www.theodinproject.com/

honestly if you don’t like the above sites : simply go and clone whatever you like on web and simply make webpages of apps/softwares you wish to use : maybe a journaling software like penzu or whatever, or just ask gpt to give you some challenge.

1. Beginner projects

- QR code component
- Profile card
- Recipe page
- Simple landing page

Focus on HTML, CSS and responsive design.

2. JavaScript projects

- Interactive rating component

- FAQ accordion
- Calculator
- To-do list

Focus on logic and functionality.

3. Slightly harder projects

- E-commerce product page
- Weather app using an API
- Multi-page website

Important: Push every finished project to GitHub. Learn how to create repositories, commit changes and push code. Don't leave GitHub for later.

- Personal portfolio

Focus on combining everything you've learned.

p.s. post everything you learn on x.com

also learn Git, GitHub and deployment

If you haven't already, learn these alongside your projects.

- Git basics: `add`, `commit`, `push`, `pull` and branches.
- GitHub: repositories, README files and project history.
- Deployment: put your websites online using GitHub Pages or Vercel.

Your projects should be viewable through both a GitHub repository and a live link whenever possible and these links on your twitter posts.

React

Once you're comfortable building projects with vanilla JavaScript, move to React.

Learn:

- Components and JSX
- Props and state

- Events and hooks
- Forms and API calls
- React Router

Then build projects like a movie search app, expense tracker or dashboard.

Resource: https://react.dev/learn

or any other yt tutorial or angela yu course

p.s. secret tip : choose tutorial like you choose movies : 15 mins into the tutorial, if you don't like it then just refer some other video, that simple

after completing this, i am pretty sure you'll figure out everything on your own.

waiting to like your twitter posts 😃
